 AB A photosensitive resin compn. contains a chelating agent 10-4-5% of the total solid matter. The resin compn. is used for photolithog., photorelief printing, and as photoresist with esp. high storage stability. Thus, a mixt. contg. Me methacrylate 45, styrene 10, acrylic acid 40, poly(butadiene glycol) (G-1000) 5, and azobisisobutyronitrile 2 g was dropwise added to butyl Cellosolve 400 g at 80.degree.. After copolymn., p-diazodiphenylamine-HCHO condensate esterified by a benzenesulfonic acid deriv. 60, Oil Blue 603 0.05, EDTA 1.6, and butyl Cellosolve 240 g were successively added, stirred for 3 h, and filtered. A photosensitive resin compn. was prepd. by mixing the above filtrate 250, iso-PrOH 1500, xylene 200, EtOAc 200, diethylene glycol diacrylate 10, 1,2-benzanthraquinone 3.4, benzoin Me ether 0.1, and hydroquinone 0.1 g. The photosensitive plate prepd. by coating the compn. was stored at 60.degree. and 90% relative humidity. Daily sampling of the material and development showed signs of deterioration (scum formation, loss of reproducibility, and defective ink reception) after 21 days storage. A control material without the chelating agent produced these defects after 5 days storage.

AB A photosensitive coating that is useful for proofing reproduction of
pos. or neg. films or plates, and that may be handled in subdued
light, is processed by exposure to uv radiation, followed by heat
development. The coating contains a heat-developable Ag salt and a
stabilizer, such as 2,6-bis(2-pyridylmethylene)cyclohexanone (I),
2,6-dicinnamylidenecyclohexanone (II), 2,6-bis[3(or
4)-pyridylmethylene]cyclohexanone, or (2-pyrid-2,5-
bispyridylmethylene)cyclopentanone. I and II may be prepd. by
condensation of the corresponding aldehydes with cyclohexanone at
50-55.degree. in anhyd. EtOH in the presence of a basic catalyst.
Crystals ppt. upon cooling. E.g., a mixt. contg. poly(vinyl
butyral) 7.6, ZnO 15.5, Ag half soap (obtained by pptn. acidic AgNO₃
and the aq. soln. of the Na salt of behenic acid) 8.9, toluene 23.5,
acetone 44.5, and I 0.03 part, is uniformly blended in a ball mill,
I being added during the final milling period, and the mixt. coated
onto supercalendered white paper at a dry wt. of 1.4 g/ft². A
coating contg. poly(vinylpyrrolidone) 4, **hydroquinone** 6,
NH₄Br 0.06, succinic acid 0.05, and MeOH 89.9 parts, is uniformly
applied over the previous coating at a dry wt. of 0.2 g/ft². This
sheet is contact-exposed through a photographic neg. by using a
140-A arc lamp at 4 ft for 1 min. The uncoated side is then
contacted with a platen, held at 195.degree.F, for 10 sec to yield a
sharp and clear pos. print of the photographic neg.
